A 90-year-old woman presented to the emergency department of University Hospital of North Staffordshire with a one-day history of breathlessness and chest discomfort. She had no history of significant respiratory or cardiovascular disease.

Clinical examination revealed elevated jugular venous pressure, minimal pedal edema, a systolic cardiac murmur, and bibasal lung crackles. An electrocardiograph demonstrated left bundle branch block and left axis deviation. A chest radiograph revealed the abnormality shown by the arrow in Figure 1 which disappeared after two days of in-hospital treatment [Figure 2].

**Question**
1. What is the clinical diagnosis?

*Answers to the quiz, and the full article, can be found online at www.omjournal.org.*
